INFORMACIÓN FINAL

PHAR presenta la información de este catálogo como un servicio a sus clientes y demás usuarios.

Sin embargo debido a que **PHAR** proporciona información de una industria en constante crecimiento, no podemos garantizar la exactitud o confiabilidad de la información contenida en este catálogo.

Le recomendamos encarecidamente que siempre verifique la información específica sobre los números de las piezas.

Proveedora de Herramientas y Accesorios para Radiador S.A. de C.V.

Todos nuestros paneles y radiadores están elaborados con materias de primera calidad, garantizando así su perfecto funcionamiento por periodo de 1 año* a partir de la fecha de nuestra factura.

*Considerando la siguiente escala:

MESES	%
0-6	100
7	90
8	80
9	70
10	60
11	50
12	40

NO procederá en los siguientes casos:

- A)** Cuando el producto presente golpes físicos y/o defectos por mal uso, negligencia o condiciones de operación mayores a las condiciones para las cuales el producto fue diseñado.
- B)** Cuando presente ataques de productos químicos, gases, líquidos o temperaturas extremas.
- C)** Cuando sea reparado o alterado fuera de **PHAR S.A. de C.V.** sin previa autorización.

PHAR S.A. de C.V. se obliga por esta garantía a reparar, remplazar o cubrir únicamente el valor del producto en cuestión.

En ningún caso se cubrirá materiales, mano de obra o partes suministradas, ni daños incidentales o consecuencias derivadas de ninguna garantía.

ELECTRÓLISIS

La Electrólisis es de las causas más importantes de desperfectos en el radiador, se provoca cuando el pH es demasiado elevado o cuando un cable eléctrico se encuentra mal aterrizado a tierra o en mal estado. Para prevenir, realizar la prueba para detectar corriente eléctrica circulando a través del radiador. (Use un voltímetro para realizar la prueba).

CONTAMINACIÓN Y ADITIVOS

La contaminación y los aditivos pueden obstruir el paso y reducir la capacidad de transferencia térmica. El uso de anticongelante concentrado o la mezcla de dos tipos de estos producirá sedimentos en el sistema. Utilizar una mezcla de 50% de agua destilada y 50% de anticongelante concentrado o un anticongelante con la mezcla preparada desde el fabricante.

NIVEL DEL PH

Un nivel inadecuado de pH en el sistema provocará la calcificación de los tubos, que causará una disminución de la circulación y aumentará la temperatura. El objetivo del mantenimiento preventivo es evitar esta situación.

TAPÓN DE PRESURIZACIÓN

El tapón mantiene constante la presión del sistema para evitar que el líquido llegue a ebullición, también debe controlar la circulación del líquido hacia el tanque de sobre flujo. Revisar el buen estado del tapón, se recomienda reemplazar al instalar un radiador nuevo.

REVISIÓN DEL TERMOSTATO

El termostato se debe reemplazar durante los mantenimientos en los cuales se cambia el anticongelante del sistema. La instalación del termostato con el rango de temperatura adecuado se debe realizar para optimizar el rendimiento del radiador y el del combustible.

DESGASTE EXTERIOR EXCESIVO

El desgaste exterior excesivo del radiador se debe al paso del tiempo y a los residuos del camino. El daño de las aletas reducirá la capacidad de enfriamiento. En estos casos reemplazar el radiador.

La garantía NO aplica en las siguientes condiciones.

- 1 Golpes físicos
- 2 Defectos por mal uso y/o instalación
- 3 Condiciones de operación mayores para las cuales el producto fue diseñado
- 4 Ataques de productos químicos o temperaturas extremas
- 5 Electrólisis
- 6 Cuando sea reparado por el cliente.
- 7 No usar anticongelante, o que sea de mala calidad.

NOTAS
